

Repair Plus™ 3-0-3 Restores Damaged Turf and Fixes Divot Damage

Divot damage and bare turf areas reduce playability and hurt your bottom line. Growth Products' new **Repair Plus™ 3-0-3** now provides golf course superintendents with an effective granular product that speeds turf repair and fixes divot damage in minimal time, with minimal fuss. Introduced in 2007, **Repair Plus's™ 3-0-3** analysis is bolstered with 2% iron and an array of biological soil amendments and plant growth stimulants.

The four strains of naturally-occurring beneficial bacillus in **Repair Plus™** work quickly to colonize the soil and the root zone, where they stimulate root development, fight off soil-borne pathogens, and promote healthy top-growth. The product's high concentration of organic humic acid and L-amino acids also accelerate seed germination and rooting, increase nutrient

uptake, and improve the soil's cation exchange capacity. The result is divot-repair heaven, and no more ugly bare spots.

Repair Plus™ is ideal for building or repairing both warm and cool season grasses. It can be used on tees, greens and fairways, or any place where turf is worn or damaged. The granular formulation saves time and labor for golf course crews, since it easily mixes with sand or other soil media and is safe to handle.

Repair Plus™ is also recommended for over seeding or when topdressing following aeration. In both cases, **Repair Plus™** will help heal damaged turf roots and encourage desired grass varieties to fill in quickly. As will all fertilizers and soil additives produced by Growth Products, **Repair Plus™** is environmentally friendly.

It rejuvenates damaged soils with organic materials while providing quick and visible results on turf. With both short-term and long-term benefits, Repair Plus is a win-win.

San Jose State University

SAN JOSE STATE UNIVERSITY

is noted for many things but when it comes to their sports field, you may remember the Major League Soccer team, the "Earthquakes" that played there for 10 years. Raul Bueno, field superintendent at San Jose State University has football, soccer, practice days, visits from the Mexican Men's Soccer league, SJSU Football, Men's and Women's Soccer teams, International & National Soccer teams, Major league Lacrosse and on and on! Add commencement ceremonies plus the High School all-stars.

Raul's field never gets a chance to rest. Add on top of that "bad timing"! Both California rains and the fall games coincide with even more stress to his fields. But what really helps those eaten up places like the 'goal mouth' and 'action spots'? Raul was one of the first to use **Repair Plus™** on his divots. Every time he mixes seed and top dressing to repair cleat marks and bare spots on his field he mixes in Repair Plus. Raul saw the difference immediately with faster germination and improved stand of the grass after it germinates. *Raul says "it works wonders on divot repairs, soccer goal mouths to establish grass again. Sometimes I throw a tarp over the seeded areas in the fall to speed up germination and it works!"*
